U05a · 24 written + 6 pen-first = 30 marks · Name: _____

Fresh authored questions. All code and answers use Python. Work on paper first; assume valid input where stated. No computer is required.

1. Ours: choose a type

Give the Python type for each value: (i) 18; (ii) 4.75; (iii) True; (iv) "R". **[4]**

2. Ours: give the values names

Write Python assignments that bind banner to "Blue lantern" and symbol to "L". **[2]**

3. Ours: what may change?

Distinguish a variable from a constant in terms of their values during program execution. **[2]**

U05a · 24 written + 6 pen-first = 30 marks · Name: _____

4. Ours: read the changing state

```
score = 3
bonus = score + 4
score = bonus + 4
bonus = score + 4
print(score, bonus)
```

(a) Trace lines 2, 3 and 4. After each line, write its line number and the values of both score and bonus. Repeat unchanged values. **[3]**

(b) Write the exact output of line 5. **[1]**

5. Ours: the input trap

```
count = input("Count? ")
print(count + 2)
```

(a) The user enters 6. State the Python type of count. **[1]**

(b) Explain why the second line fails. **[1]**

(c) Rewrite only the first line so the addition works for valid whole-number input. State the output after entering 6. **[2]**

6. Ours: make the next edit easier

A bicycle-hire program repeats the hourly rate, 9, in several calculations. A developer proposes the meaningful name HOURLY_RATE.

(a) Write one Python statement that gives the value 9 to a name following the uppercase constant convention: HOURLY_RATE. **[1]**

(b) Explain two benefits of replacing the repeated literal 9 with that named constant in this program. **[2]**

(c) State one way a useful comment helps someone maintain this program. **[1]**

7. Ours: the quotes and the language

(a) State the Python type of `"R"` and of `'R'`. State whether these two values are equal. **[2]**

```
LIMIT = 12      # int
LIMIT = "open"
print(LIMIT)
```

(b) State the exact output. Explain why neither the uppercase name nor the type comment prevents this result in Python. **[2]**

U05a · 24 written + 6 pen-first = 30 marks · Name: _____

8. Ours: the badge desk · pen first

💻 **6 marks · design before code.** A badge desk charges 7 currency units per badge. Input a visitor label (text), then a badge count (a valid non-negative whole number). Store the fixed unit price using a named constant convention, calculate the total and output the visitor label and total. No decisions or loops are needed.
Optional after writing: type Q8(b) into `challenge_U05a_TheBadgeDesk.py` and run it. All six marks are human marked; a computer is not required.

(a) Write numbered steps or draw a flowchart for this sequence, from inputs through calculation to output. **[2]**

(b) Write the Python program. Use meaningful identifiers and clear output. **[3]**

(c) For visitor label Guest and badge count 4, state the label and total your program must output. **[1]**

Above and beyond · outside the 30 marks. Start with `a = 5` and `b = 13`. Using assignments and a third name, swap the values without losing either original value. Trace your steps. Why does `a = b; b = a` fail?

Additional space - label the question number.
